

Relay Circuit for Positive Switching

NOTE: Use this option to wire an accessory that requires a chassis ground. The Trigger switches the Negative side of the circuit, so if an accessory is wired to chassis ground instead of using the supplied harness connections, it will not shut off. This simple relay circuit will shut off the positive circuit using the power from the Trigger only, no additional run of power is required.

Note: The strobe function will still work from the app when wired this way but the dim function will be very noisy at the relay.
